

FPT Legacy Modernization Services

2024/2/28

FPT experience

Since 2006, we have implemented legacy migrations for customers in various countries. We have successfully implemented our customers' projects with our accumulated experience and extensive human resources.

- More than 17 years of experience
- Experience of deploying projects in many countries around the world, including Japan
- Experience with nearly to 200 migration projects
- Validated methodologies and work processes through many projects
- Provide consulting to help customers choose the most effective plan for them with different migration implementation methods.
- A set of tools used in the assessment and migration process that we have created and improved in-house over many years.

FPT initiatives

From 2023, we have positioned "Legacy Modernization" as an important program and have established a specialized organization.

Strengthen contribution to market needs

- Increased need for de-hosting (legacy migration)
- Increased need to address the shortage of host engineers (increased consultation on "skills and know-how transfer" as engineers retire)

Legacy Modernization Initiatives

1. Expansion of mainframe experts and people with experience, including the establishment of CoE and building knowledge pool.
2. Expansion of in-house tools and methodologies
3. Strengthening of alliances (tools from other companies): Tools made by company K in Japan, tools made by company A in the US, tools made by company B in Spain, etc.

Overall picture of legacy modernization services (2/3)

We are significantly strengthening our mainframe human resources in order to "maintain current systems on mainframes" and "implement legacy modernization."

Number of mainframe resources

Senior Resource Development

In 2024, we are developing 300+ senior resources.

COBOL Academy

We will develop 2000+ mainframe engineers by 2025.

	2024	2025
CoE (Expert)	: 10+ people	: 20+ people
Trainer of designers	: 100+ people	: 100+ people
Senior programmers/testers	: 100+ people	: 300+ people
Programmers and testers	: 500+ people	: 600+ people

FPT Legacy Migration End to End Service

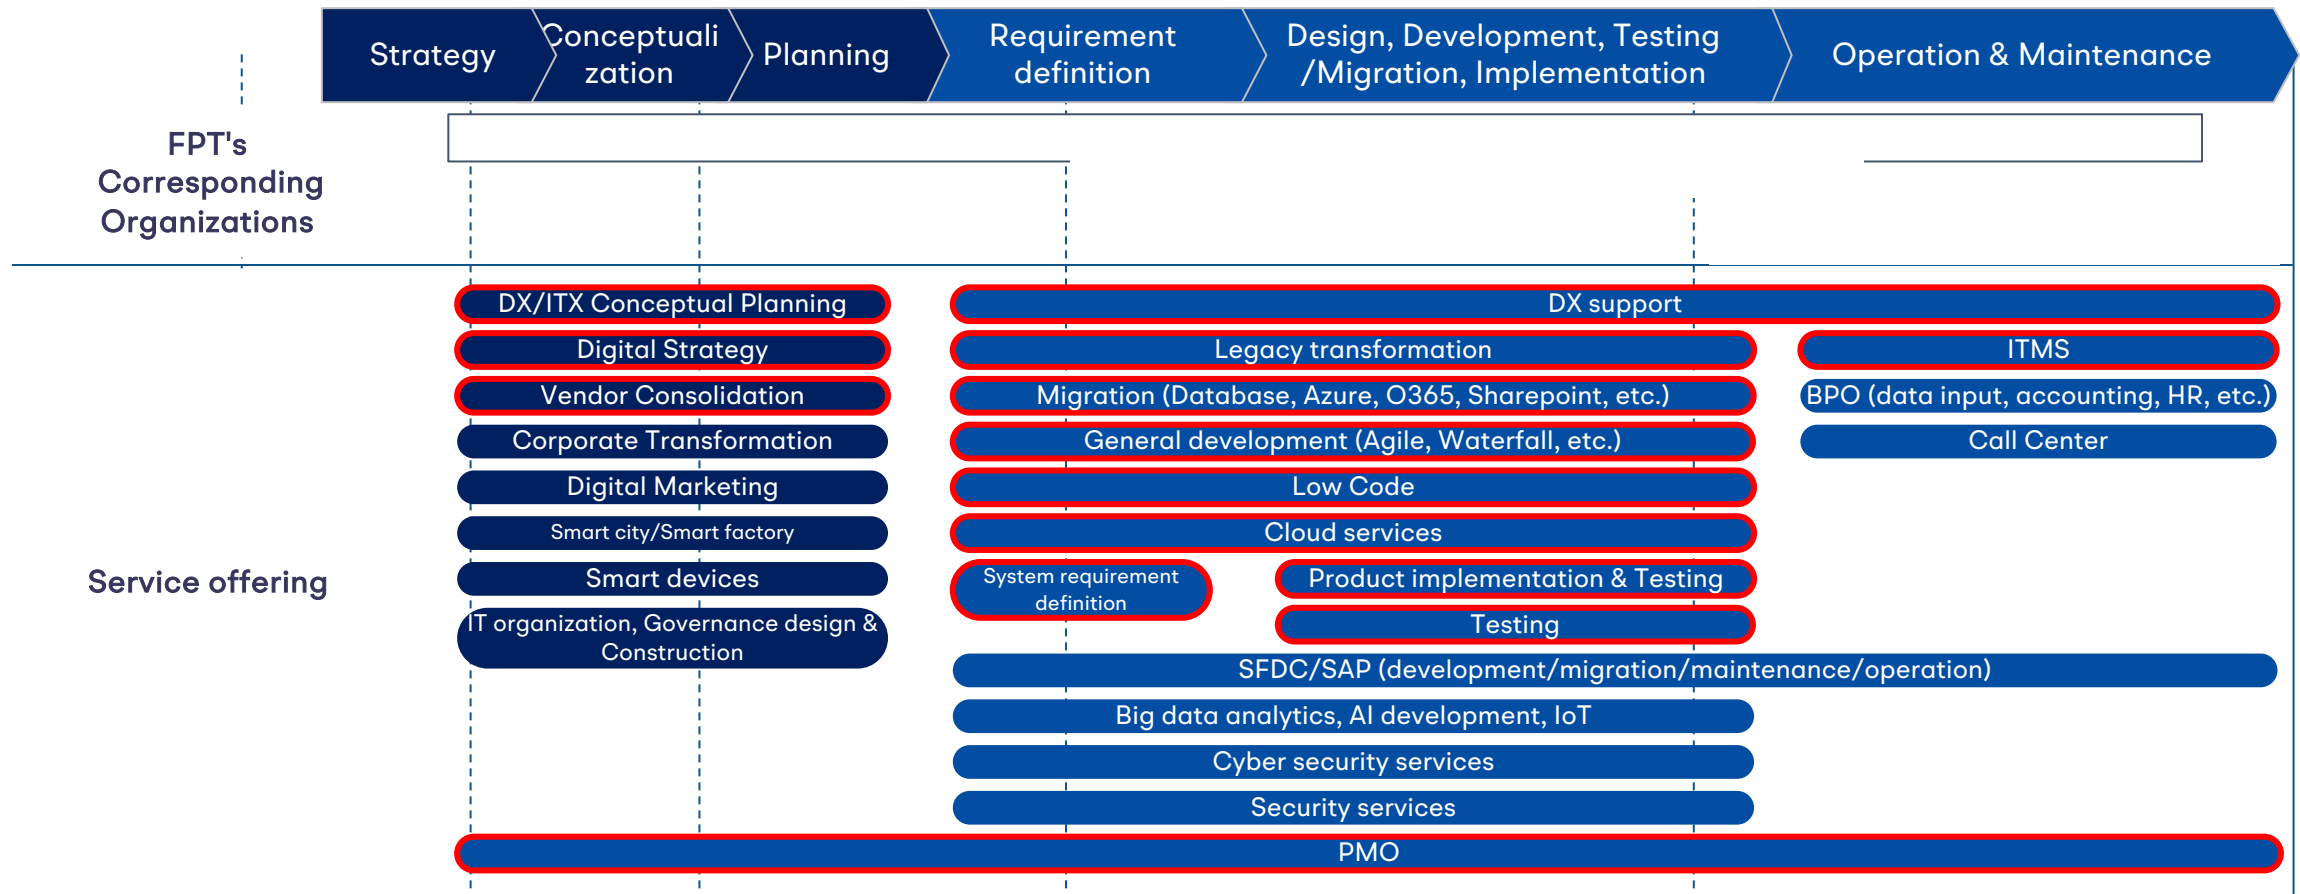

For legacy migration, FPT provides consistent services from consulting to development, maintenance and operation. We implement projects while optimizing costs by taking advantage of offshore's extensive resource supply.

[Legend]

Strong services related to legacy migration

FPT Service map

Overall picture of Modernization services (2/2)

FPT provides migration services in four areas.

In projects, we combine these services and scratch development to provide a total service tailored to the customer's needs.

① LEGACY MIGRATION

COBOL

Introduction of FPT's tool “EMT”

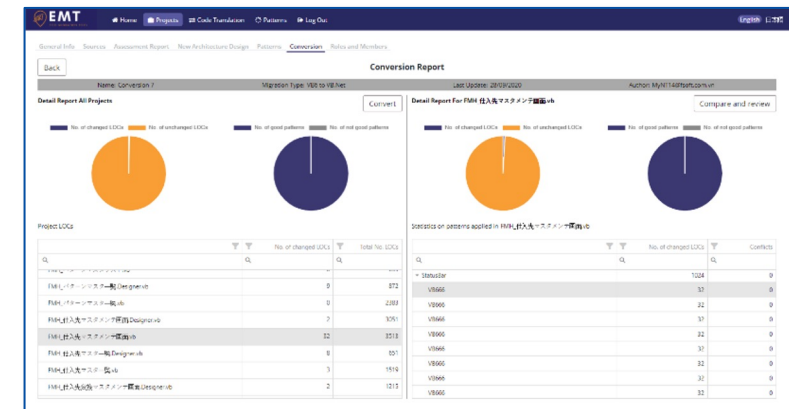

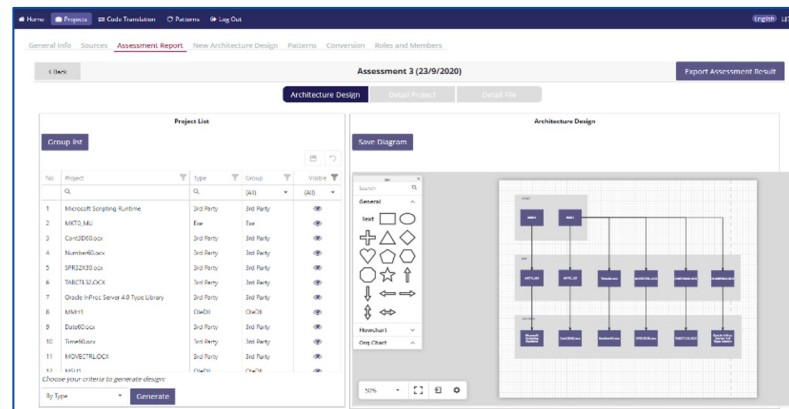

FPT has developed the tool “EMT” in-house and has used it in more than 50 projects in recent years. The migration tool places great importance on the ability to customise the conversion patterns for the inherent logic during project execution.

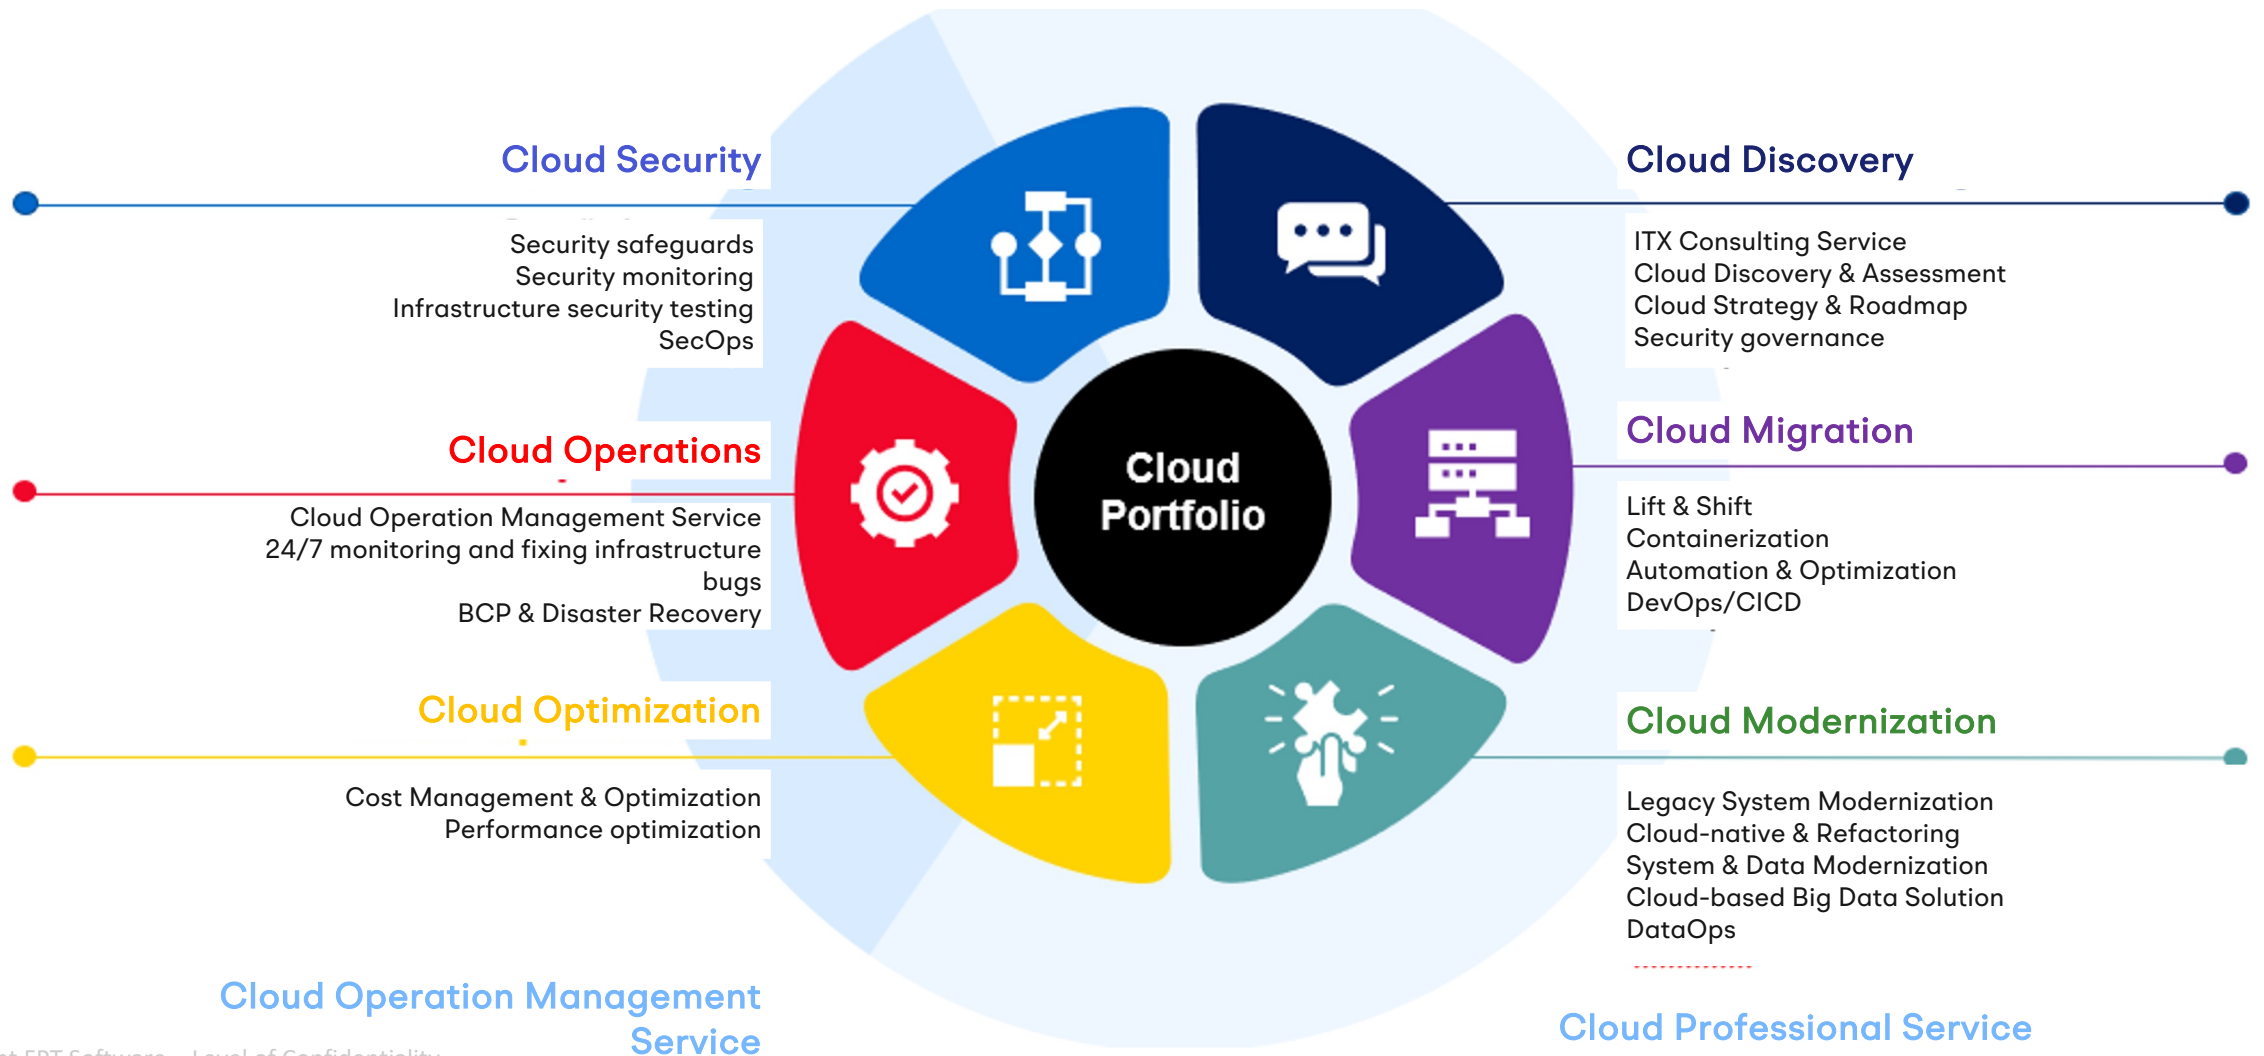

- Through long-term mainframe migration work, FPT has developed an ecosystem, which has been used in more than 50 projects in recent years.
- The tool has been integrated and tested with all the tools used in previous projects and reviewed by the customer, resulting in an 80% reduction in man-hours and a 90% reduction in errors.
- During the operational process, new functions are continuously added to meet new conversion patterns and challenges, improving the accuracy and speed of the tool.
- Assessment tools and Reverse engineering tools have also been created alongside the migration function.

EMT tool's screen example:

No	File Name	No. of LCLs	No. of Base	No. of Contents	No. of Job Body LCLs	No. of Conversion Job Party	Libs	Related Projects
1	マシ 検査器	7537	612	1567	3652	164		
2	OMI_ADANCE システム	30	7	1	0	0		
3	OMI_ADANCE システム	47	15	13	0	0		
4	OMI_システム	53	15	90	0	0		
5	OMI_システム	47	21	15	0	0		
6	OMI_システム	35	21	4	0	0		
7	OMI_システム	46	22	18	0	0		
8	OMI_システム	55	21	25	0	0		
9	OMI_システム	45	25	18	0	0		
10	OMI_システム	55	21	25	0	0

12	OMI_システム	114	11	8	0	0		
Total		26228	2842	27074	7497	152		

FPT can provide the total services necessary for cloud usage from start to finish.

Key points of application development in the cloud

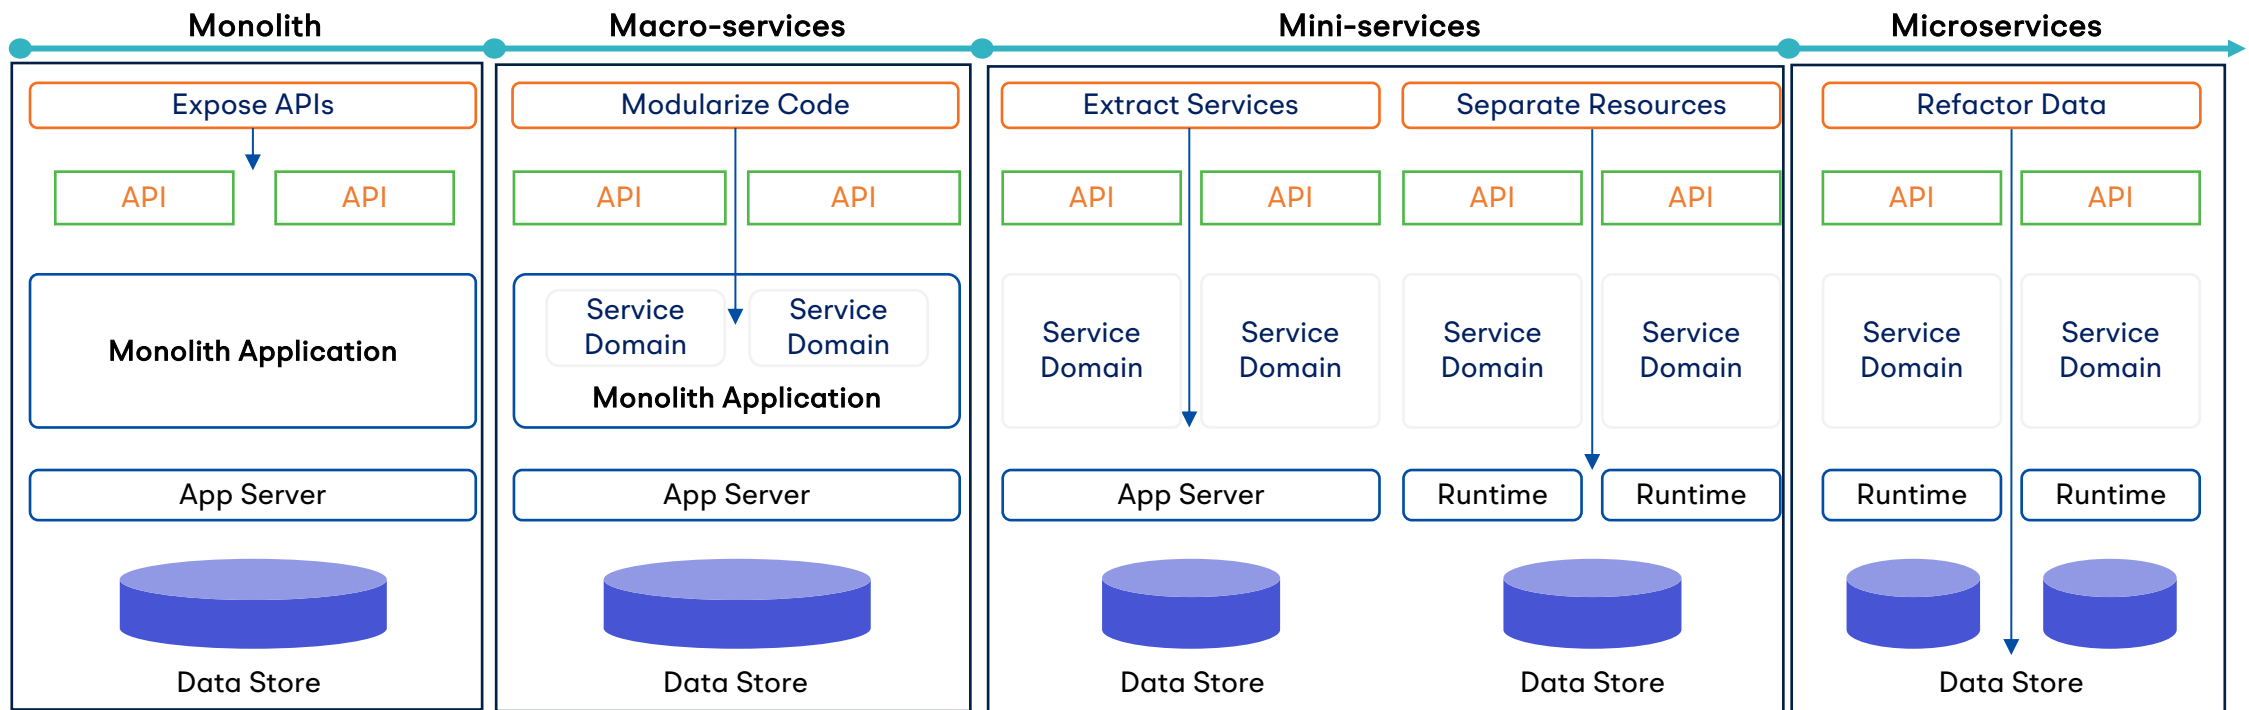

The following points will be promoted as key points in application development

Key points	Response policies
Selection of development method	<ul style="list-style-type: none">• Select the optimal target development method such as waterfall or agile development for the requirements, and start full-scale work after small-scale trial verification.
Application Foundation	<ul style="list-style-type: none">• Strengthening security operations and protection• Enhance the automation and efficiency of software development by implementing CI/CD pipeline
UI/UX design	<ul style="list-style-type: none">• Understand user needs and requirements, adopt our processes, and proactively gather user feedback to improve the UI.
De-monolithic, architectural changes	<ul style="list-style-type: none">• When building more scalable applications, consider migrating from current system to a microservices architecture using cloud-native implementation and containerization.
Security measures	<ul style="list-style-type: none">• Enhance security to ensure early detection and prevention of risks (SQL injection attacks and DDoS attack countermeasures, threat detection and prevention, vulnerability assessment, unauthorised activity monitoring).
Performance measures	<ul style="list-style-type: none">• Distribution, caching, etc. are designed in advance to increase the speed of the system and to cope with the increase in the number of users.
Implementation of CI/CD	<ul style="list-style-type: none">• Implementation of CI/CD flows to facilitate automation and efficiency in the software development process, ensure efficient and rapid application development and quality improvement from development to operation.

Application development ~ De-monolithic, containerization ~

When building more scalable web applications, the migration from the current system to a microservices architecture with cloud-native implementation and containerisation is carried out.

- Optimizing the application modernization process by combining macro-services, mini-services and microservices using FPT-developed M*-services tools
- Experienced engineers with expertise in microservices conversion from current systems, which can be sophisticated and complex

Current → ToBe

Ease of coupling, Increased development agility, Increased portability/flexibility of deployment
Improved scalability accuracy

Addressing the “Human Resources Shortage”

We are currently receiving inquiries from a variety of customers regarding “de-hosting (legacy migration)”. Some common issues have been observed, and it is assumed that this is becoming a common issue in the IT market. FPT has developed a methodology to deal with this issue.

Main Challenges (examples)

- No Host engineer
- No specifications (not up-to-date) and no members of the team know the specifications
- Each system, data, and program is tightly coupled
(It is necessary to implement de-hosting while resolving the tight coupling).
- Multiple large-scale systems are mixed together and it is not organized how to migrate them.
(Difficult to switch between big bang and large lots).
- A migration policy for de-hosting has not been determined
(Investment in core and competitive areas can be made to develop new systems, but investment in other areas is limited and a migration policy cannot be determined).
- A host-open data integration infrastructure is needed, but no concrete method has been decided.

Countermeasures (proposal)

- 1 Human resources transformation**
Develop and implement a human resources plan for the transformation of human resources
- 2 Establishment of a lab-based system**
“De-hosting (legacy migration)” and “Maintenance of current systems” at the same time.
- 3 Promote the application of new technologies and DX.**
In addition to “maintenance of new systems” after migration, determine and apply the scope of application of new technologies and promote DX at the same time.

Addressing the “Human Resources Shortage”- Overall roadmap (image) -

A lab-based system is **established** and handled to **make effective use of the limited time of current system experts** and to implement both “skill and know-how transfer” and “legacy migration”, plus “maintenance of current and new systems”.

		2024	2025	2026	2027	2028	2029	2030	
1	De-hosting Step	Step 0 Establishment of laboratory system, Analysis/Planning/PoC	Step 1 Pilot implementation, Development&Management methods/Preparation for Procedures, Deployment		Step 2 Horizontal deployment, Speed-up			Step 3 De-mainframe termination	
	Human Resources Transformation	Resources, Reskilling Planning	Employees of user companies Detailed status survey; Handover planning; Establishment of new and change management processes and rules; Routine, request and fault work handover; Shadowing; Reverse shadowing; Creation of additional procedures; Production operation FPT Resource					Operation under new system	
2	Current system maintenance	Support for changes to HW/SW resources on mainframes (e.g. support for compartmentation, downsizing and racking reviews on hosts to reduce licence costs/DC usage fees)							
		Maintenance (e.g. Support on legislative changes)							
		Support on the current system side for each legacy migration (e.g. support for some specification changes, support for integration testing, etc.)							
2	De-hosting (legacy migration project)	Analysis/Planning/PoC	A System (pilot)		B System		C System		
							X System		
3	New system maintenance (after migration)	Support on the new system side for each legacy migration (e.g. support for some specification changes, support for integration testing, etc.)							
		Maintenance (e.g. Support on legislative changes, Support on EOS)							
		Investigation of new technologies, identifying and applying the scope of application and DXing (modernisation)							

Thank you.
